

AI Learning Series

A 6-Part Training Program — Draft Outline for Core Team Review

Overview

A six-session series that takes Agile in Color members from AI curiosity to practical, confident use, with an honest look at bias and a clear path into emerging AI roles. Sessions are designed to be hands-on and workshop-heavy, since that is what makes the skills stick.

Audience: Agile professionals (scrum masters, coaches, product owners, delivery leads).
Non-technical, curious about AI.

Format: 6 sessions, 60–90 minutes each, with live practice in most sessions.

Assumptions to confirm: member seniority mix (junior/mid/senior), session length, and lecture vs. workshop balance. These affect pacing, especially in Session 1.

Session 1 — AI Foundations Without the Hype

Level-set so everyone starts from the same place.

- What generative AI actually is and isn't, in plain terms: LLMs, prompts, tokens, and what “hallucination” means.
- Why it matters for agile roles specifically.
- Live demo of one tool (ChatGPT or Claude).
- **Homework:** each person picks one recurring task in their job to bring back later.

Session 2 — Prompting Like a Pro

The single most useful skill in the series.

- How to write clear prompts: give context, use examples, ask for a format.
- Common mistakes and how to fix them.
- Live practice on real work tasks (retro summary, user story, cleaning up meeting notes).
- This is where most people get their first “oh, I get it” moment.

Session 3 — AI in the Agile Workflow

Concrete applications for the day job.

- Drafting user stories and acceptance criteria; summarizing standups and retros; prepping sprint reviews; status updates; meeting agendas.
- Real before/after examples, not theory.
- **Hands-on:** rewrite one of their own artifacts with AI help.

Session 4 — Bias, Ethics, and Why This Matters for Us

The part that makes this series different for an Agile in Color audience.

- How AI models carry bias and why representation in the data matters.
- Where these tools fail people of color specifically.
- How to use AI critically rather than trusting it blindly, with real examples.
- Goal: build judgment, not fear.

Session 5 — Building Something Real

A hands-on project session.

- Each member builds one useful thing they'll actually use: a prompt library, a custom GPT/assistant for their team, an automated meeting-notes workflow, or a job-search toolkit.
- Small groups, lots of doing, instructor floating to help.

Session 6 — AI and Your Career

Practical and forward-looking.

- Talking about AI skills in interviews and reviews.
- Using AI to level up: learning new frameworks, prepping for certs, resume and LinkedIn work.
- An honest look at what AI means for agile jobs.
- Ends with a personal action plan so nobody leaves without a next step.

Where Agilists Fit in the AI Space

Core message: agile skills (facilitation, delivery, stakeholder management, breaking big ambiguous problems into shippable pieces) transfer directly into AI work. These roles are real and hiring now:

- **AI Delivery Lead / AI Program Manager** — running delivery of messy, iterative AI/ML projects.
- **AI Product Owner / Product Manager** — owning the backlog for an AI feature or product.
- **Scrum Master / Agile Coach for AI/ML teams** — coaching teams that run on experiments and research spikes.
- **AI Governance / Responsible AI Lead** — ensuring AI is built and used ethically; ties straight to Session 4.
- **AI Orchestrator / Workflow Designer** — designing and running workflows where multiple AI agents, tools, and humans each do a piece of the job.
- **AI Adoption / Change Lead** — helping organizations actually roll out AI tools and get people to use them.
- **AI Business Analyst / Solutions Consultant** — translating between business needs and AI capabilities.

Takeaway: you don't need to become a data scientist to have a career in AI. The gap on most AI teams is delivery, coordination, and ethics — exactly what this community already knows how to do.

Mapping Today's Roles to AI Roles

What is an AI Orchestrator? The person who designs and runs a workflow where multiple AI agents, tools, and humans each handle a piece of a larger job. You are not building the models. You decide

which agent does what, in what order, where a human checks the work, and how the pieces hand off. Same muscle a scrum master already uses, new players.

Scrum Master → AI Orchestrator / AI Workflow Designer. Removing blockers, keeping work flowing, and managing handoffs is exactly what orchestrating agents needs. The shift: some “team members” are now AI agents that need clear instructions, guardrails, and a human checkpoint.

Should learn: prompting first (non-negotiable); the basics of AI agents vs. a single chatbot; one orchestration/automation tool (Zapier or Make for no-code, or n8n, CrewAI, Microsoft Copilot Studio to go deeper); the “human in the loop” concept; and thinking in inputs → steps → outputs.

Agile Coach → AI Adoption Lead / Responsible AI / Governance Lead. Coaches already do the hardest part of AI adoption: getting humans to change how they work and trust a new way of doing things.

Should learn: how AI models fail and carry bias (ties to Session 4); the basics of AI governance and emerging rules like the EU AI Act and company AI policies; change management framed for AI specifically; and enough hands-on use to coach from real experience, not theory.

Product Owner → AI Product Owner / AI Orchestrator. Deciding what a workflow or model should produce is a backlog-and-priorities job.

Two Honest Cautions

- **Titles aren't standardized yet.** “AI Orchestrator” appears on some postings but the same work hides under AI Program Manager, Automation Lead, or AI Product Manager. Teach the skills, not the buzzword.
- **Pivots only work if people get their hands dirty.** The agilists who make the jump are the ones actually building small workflows, not the ones who only talk about AI in the abstract.

Open questions for the core team: Confirm member seniority mix, session length, and whether we want this lecture-heavy or workshop-heavy (currently weighted toward hands-on). We can also add a per-role “how to pivot” path or convert this into slides / a facilitator guide.
